## Implement Queue using Stacks

Implement a first in first out (FIFO) queue using only two stacks. The implemented queue should support all the functions of a normal queue (push, peek, pop, and empty).

Implement the MyQueue class:

- void push(int x) Pushes element x to the back of the queue.
- int pop() Removes the element from the front of the queue and returns it.
- int peek() Returns the element at the front of the queue.
- boolean empty() Returns true if the queue is empty, false otherwise.

#### Notes:

- You must use **only** standard operations of a stack, which means only push to top, peek/pop from top, size, and is empty operations are valid.
- Depending on your language, the stack may not be supported natively. You may simulate a stack using a list or deque (double-ended queue) as long as you use only a stack's standard operations.

### Example 1:

#### Input

```
["MyQueue", "push", "push", "peek", "pop", "empty"]
[[], [1], [2], [], []]
```

#### Output

```
[null, null, 1, 1, false]
```

#### **Explanation**

```
MyQueue myQueue = new MyQueue();
myQueue.push(1); // queue is: [1]
myQueue.push(2); // queue is: [1, 2] (leftmost is front of the queue)
myQueue.peek(); // return 1
myQueue.pop(); // return 1, queue is [2]
myQueue.empty(); // return false
```

#### **Constraints:**

- 1 <= x <= 9
- At most 100 calls will be made to push, pop, peek, and empty.
- All the calls to pop and peek are valid.

# Output in cpp:-

```
class MyQueue {
private:
  stack<int> s1;
  stack<int> s2;
public:
  MyQueue() {}
  void push(int x) {
    while (!s1.empty()) {
      s2.push(s1.top());
      s1.pop();
    }
    s1.push(x);
    while (!s2.empty()) {
      s1.push(s2.top());
      s2.pop();
    }
  }
  int pop() {
    int temp = s1.top();
    s1.pop();
```

```
return temp;
}

int peek() {
    return s1.top();
}

bool empty() {
    return s1.empty();
}
```
